Chart FX 7

Chart FX isn't your typical new version but a completely re-engineered data visualization solution. By taking full advantage of Visual Studio and the ASP.NET 2.0 specific features, Chart FX again raises the bar to a level that other charting components won't be able to reach.

★ **Redesigned User Interface (UI):**
Chart FX provides a richer user interface that seamlessly integrates into your Smart Client and ASP.NET applications. Toolbars and other UI appear on demand at an end user's request while still maintaining a clean and elegant display.

Default Chart Settings:
The Chart FX default chart has been optimized according to the platform for which you are writing. Visual attributes, such as gradients, color palettes, toolbars and legends will be customized automatically based on the chart size and platform selection.

Installer:
Our custom installer takes advantage of the Visual Studio automation model to setup your development environment and allow you to quickly integrate charts.
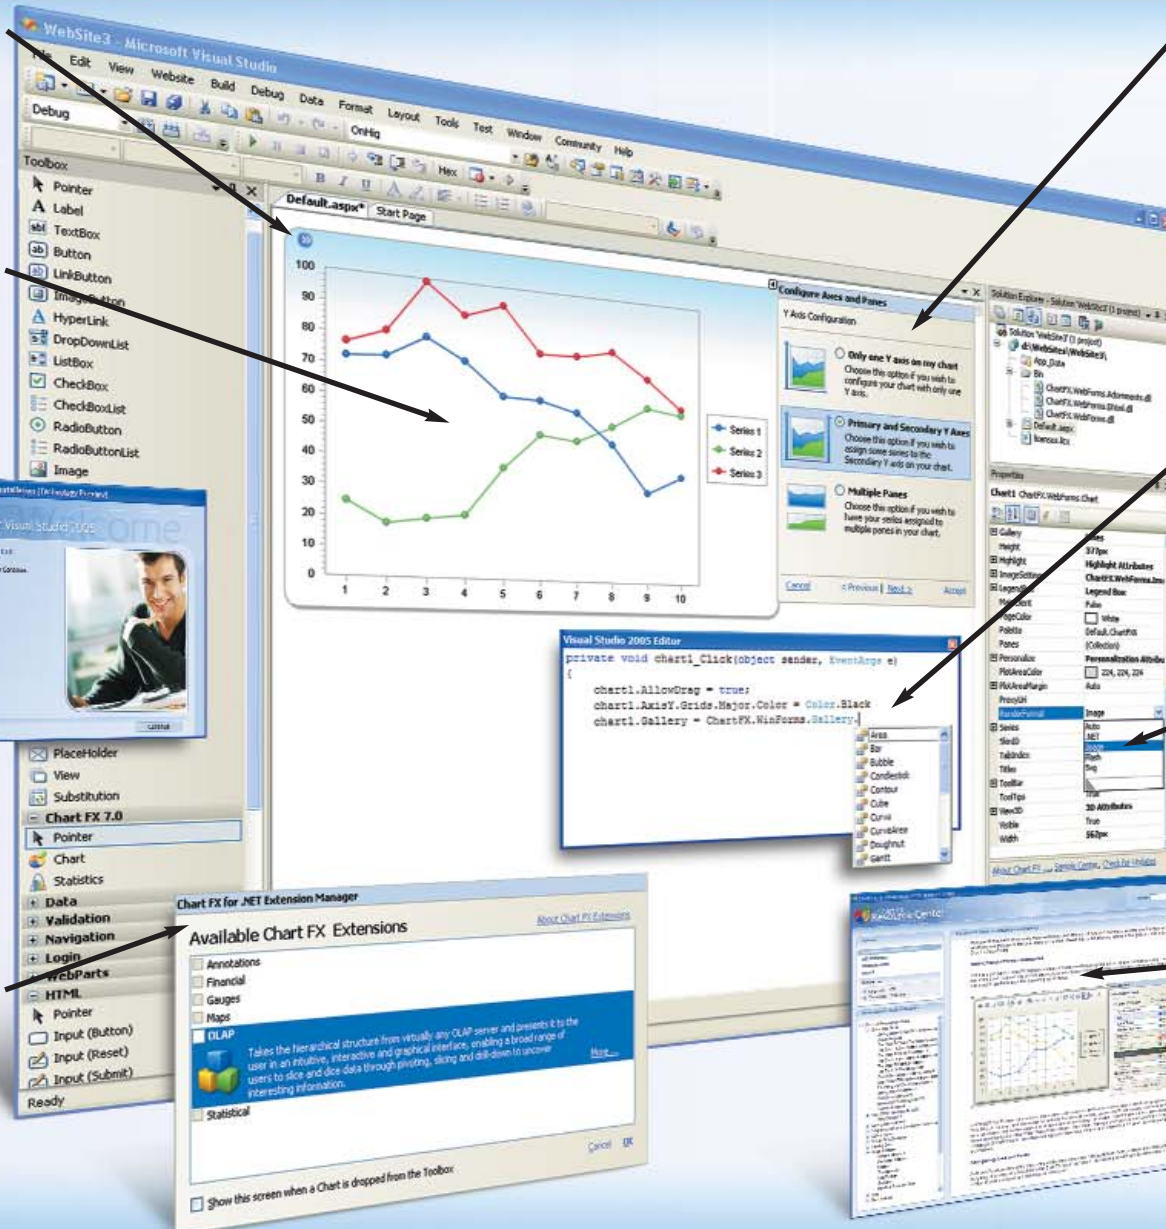

Support for Visual Studio Themes:
Chart FX is compatible with Visual Studio Themes. Any changes that you make to a Theme are extended to all Chart FX controls on the page.

★ **Chart FX Extension Manager:**
Chart FX standardizes our extensibility infrastructure which allows Chart FX to adapt quickly and effectively to verticals like real-time, financial, statistical, maps and OLAP, among others.

★ *Patent Pending.*

Smart Tag Wizards: ★
The Chart FX Smart Tag Wizard does not display modal dialogs which alienate the development experience; all steps are presented within the smart tag itself adhering to Visual Studio standards and providing a familiar, powerful interface.

Data Wizard: ★
Chart FX encapsulates a full Data Wizard that allows a developer to map fields in a database or business object to a chart and instruct Chart FX how to process and use this information.

New Powerful API:
The Chart FX API was created with the Visual Studio object model in mind. Now it will be easier to access complex functionality and quicker to integrate into your C# or VB.NET applications as objects and classes are more recognizable and easier to code.

DHTML Rendering Engine: ★
Chart FX takes advantage of Visual Studio's out of band callbacks capability and combines it with a powerful DHTML engine to produce chart images that allow fully secure interactivity and support state in web applications.

Redesigned Resource Center:
Whether you are just starting with Chart FX or you are an experienced Chart FX developer, the Resource Center will provide a wealth of documentation and samples that will help you attain the most benefit from Chart FX in Visual Studio.
